Amendment to OPSS 363, April 2008

OPSS 363, Construction Specification for Repairing Rigid Pavement with Precast Concrete Slabs is deleted in its entirety and replaced with the following:

363.01 SCOPE

This specification covers the requirements for repairing rigid pavement with precast concrete slabs using either the Fort Miller Super-Slab\textsuperscript{®} Method or the Michigan Method. The work may include both continuous and intermittent slab repairs.

363.02 REFERENCES

This specification refers to the following standards, specifications, or publications:

363.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Bedding Grout** means a thin non-structural grout pumped into the grout distribution system, which is cast in the bottom of the Fort Miller Super-Slab® Method to fill voids beneath the slabs, to provide uniform support to the slab.

**Cement Treated Base** means granular base material stabilized with Portland cement.

**Continuous Precast Concrete Slab Repair** means the continuous replacement of multiple consecutive slabs of concrete pavement with inter-connecting precast concrete slabs.

**Diamond Grinding** means altering the profile and texture of a concrete pavement surface by using grinding equipment that employs diamond tip blades.

**Intermittent Precast Concrete Pavement Slab Repair** means a 2 to 4.5 m long repair carried out using a single precast slab.

363.04 DESIGN AND SUBMISSION REQUIREMENTS

363.04.01 Submission Requirements

363.04.01.01 Precast Concrete Pavement Slab Repair Plan

At least 2 weeks prior to the start of the work, the Contractor shall provide to the Contract Administrator details on the method of:

a) Fabrication, transportation, and installation of each precast concrete slab repair method.
b) Removal of existing concrete (i.e., sawcutting, removal, equipment, and disposal).
c) Removal of hot mix asphalt repair.
d) Base preparation.
e) Precast slab placement.
f) Grouting (i.e., equipment to be used for mixing and installing).

363.04.01.02 Precast Concrete Mix Design

The Contractor shall be responsible for the precast concrete mix design and shall submit the concrete mix design to the Contract Administrator at least 2 weeks prior to the start of the work.
Documentation shall be included with the submission of the mix design that demonstrates the proposed mix design and materials meet the requirements of this specification, including the air void system in the hardened concrete and the minimum specified 28 Day compressive strength.

All supporting test data shall not be more than 12 months old at the time the concrete mix design is submitted to the Contract Administrator.

363.04.01.03 Flowable Fill Mix Design – Michigan Method

When flowable fill is used as a levelling material, the Contractor shall submit a concrete mix design for flowable fill to the Contract Administrator at least 2 weeks prior to the start of the work. Trial batch documentation shall also be submitted to the Contract Administrator for review a minimum of 7 Days prior to placement.

363.04.01.04 Proprietary Concrete Repair Material (PCRM) - Product Details

At least 7 Days prior to commencement of the work, the Contractor shall submit to the Contract Administrator the name of the PCRM selected for use and the manufacturer’s specifications and recommendations for placement. The submission shall also include documentation verifying the suitability of the product for the application and evidence of successful performance in a similar application. The PCRM and supporting information provided by the Contractor shall be acceptable to the Owner.

363.04.01.05 Chipping Hammer

At least one week prior to commencement of the work, the Contractor shall submit to the Contract Administrator a copy of the manufacturer’s published specifications on the chipping hammers to be used.

363.05 MATERIALS

363.05.01 Precast Concrete Slabs

363.05.01.01 General

The minimum compressive strength of concrete at 28 Days shall be 30 MPa. Testing of the concrete compressive strength shall be carried out according to CSA A23.2.

The air void parameters of the hardened concrete shall be a minimum air content of 3% and a maximum spacing factor of 0.230 mm.

Concrete shall meet the requirements of the materials section of OPSS 350 and OPSS 1350 with the following exceptions and additions:

a) Concrete aggregates shall be according to OPSS 1002.
b) The nominal maximum size of coarse aggregate shall be 19 mm.

363.05.01.02 Finishing

Finishing of precast concrete slabs shall be according to OPSS 350.
363.05.01.03  Texturing of Surface

Texturing of the precast concrete slab surface shall be according to OPSS 350 except that manual devices may be used to provide the required tined texture.

363.05.01.05  Dimensions

Precast concrete slabs shall be full lane width and length of 2 to 4.5 m. Prior to fabrication, the Contractor shall determine the concrete thickness at each repair location. Slabs may be cast a maximum of 15 mm thinner that the existing concrete to be repaired, to accommodate the bedding material.

363.05.02  Fine Aggregate for Base Preparation – Fort Miller Super-Slab® Method

Fine aggregate for base preparation shall be 100% crushed fine aggregate, with a plasticity index of 0% according to LS-704 and a maximum micro-Deval abrasion loss of 35 according to LS-619. Fine aggregate means that portion of aggregate material passing the 4.75 mm sieve when tested according to LS-602.

363.05.03  Flowable Fill - Michigan Method

Flowable fill shall consist of a mixture of Portland cement, coarse and fine aggregate, fly ash, and water, and may contain air entraining admixture or ground granulated blast furnace slag or both.

Portland cement shall be Type GU cement according to CSA A3000.

Fly ash shall be according to CSA A3000.

Coarse and fine aggregate shall meet the requirements of OPSS 1002 and shall have a maximum aggregate size of 12.5 mm.

The compressive strength of the flowable fill mixture shall not be less than 0.5 MPa or greater than 1.0 MPa at 28 Days.

If an air entraining admixture is used, then the air content of the flowable fill shall not exceed 35% of the flowable fill volume.

363.05.04  Bedding Grout - Fort Miller Super-Slab® Method

Bedding grout shall be a mixture of cement, water and plasticizing admixture. The grout mixture shall have a flow rate of 17 to 22 seconds as measured by ASTM C 939 to ensure fluidity. The compressive strength of the bedding grout shall be a minimum of 2.0 MPa at 12 hours.

363.05.05  Tie Bars and Dowel Bars

Tie bars shall be according to OPSS 1440. Dowel bars shall be according to OPSS 1441.

363.05.06  Expansion Caps for Dowel Bars

Caps shall be tight fitting and made of compressible, non-absorptive, closed cell polyethylene that will allow approximately 6 mm movement at the end of the dowel bar.
363.05.07  Bond Breaker

Dowel bars shall be coated with RC-250, Tectyl 506, or an approved equivalent.

363.05.08  Proprietary Concrete Repair Material

The PCRM selected shall be suitable for the application.

The minimum compressive strength of the PCRM at 28 Days shall be 30 MPa.

The PCRM for use in the dowel grout of the Fort Miller Super-Slab® Method shall be capable of being pumped into the inverted dovetail slots.

363.05.09  Epoxy Adhesives

Epoxy adhesives shall be from the Owner’s approved product list and shall be of the type intended for horizontal dowel application and mixed in the cartridge nozzle.

363.05.10  Joint Materials

The joint sealant material shall be according to OPSS 369.

363.05.11  Water

Water shall be according to OPSS 1302.

363.06   EQUIPMENT

363.06.01  Screeding Device for Base Preparation

The screeding device used for fine grading for base preparation shall be laser or otherwise mechanically-controlled and shall be capable of fine grading fully compacted fine aggregate or flowable fill to a tolerance of 3 mm.

363.06.02  Gang Drill

The gang drill shall consist of not less than three independently powered pneumatic drills.

363.06.03  Chipping Hammer

Chipping hammers shall be hand held and have a maximum weight of 9.0 kg prior to any handle modification where applicable and a maximum piston stroke of 102 mm. All hammers shall have the manufacturer’s name and parts or model number engraved on them by the manufacturer. All information must be clearly legible. The manufacturer’s published specifications shall be the sole basis for determining weight and piston stroke.

363.06.04  Gang Saw

The gang saw shall have gang-mounted diamond saw blades and shall be capable of cutting at least 3 parallel slots simultaneously at a slot spacing of 300 mm within a tolerance of 3 mm.
363.06.05  Compressor – Air Blasting

The compressor for air blasting shall have a minimum capacity of 3.5 m³/min. The compressed air shall be free from oil and other contaminants.

363.06.06  Consolidating Equipment

Internal vibrators used to consolidate the PCRM in the dowel bar slots shall have a maximum diameter of 25 mm and shall have a resilient covering that will not damage the epoxy coating during use.

363.06.07  Hand Finishing Equipment

Hand finishing equipment shall be according to OPSS 904.

363.06.08  Straight Edges

Straight edges shall be according to OPSS 904.

363.07  CONSTRUCTION

363.07.01  General

Precast concrete pavement slab repairs shall be carried out at the locations identified in the Contract Documents. The work may include both continuous and intermittent slab repairs.

Acceptable methods of intermittent slab repair are the Fort Miller Super-Slab® Method and the Michigan Method, as modified by the requirements of this specification.

Acceptable methods of continuous slab repair are the Fort Miller Super-Slab® Method as modified by the requirements of this specification, or the Contractor may elect to use an alternative continuous precast method with demonstrated and documented good field performance under similar conditions, such as precast, prestressed concrete.

363.07.01.01  Fort Miller Super-Slab® Method

In the Fort Miller Super-Slab® Method, the work shall consist of fabricating precast concrete pavement slab repairs (i.e., Super-Slab®), sawcutting and removing the existing concrete pavement, repairing and compacting the existing subbase as necessary, placing and grading fine aggregate base material, inserting and securing dowel bars and tie bars, placing precast slabs, installing PCRM in inverted dovetail slots, installing bedding grout beneath the slabs, and sealing of joints.

363.07.01.02  Michigan Method

In the Michigan Method, the work shall consist of fabricating precast concrete pavement slab repairs with dowel bars, sawcutting and removing the existing concrete pavement, constructing dowel bars slots, placing of flowable fill levelling material, placing precast slabs, installing PCRM in dowel bar slots, and sealing of joints.
363.07.01.03  Trial Slab Repair

Prior to carrying out the precast concrete pavement slab repair, the Contractor shall demonstrate to the Contract Administrator the ability to successfully carry out the slab repair according to this specification by placing a trial repair slab within the Contract limits.

In lieu of a trial slab repair, the Contractor Administrator may accept evidence that the Contractor has demonstrated the ability to successfully conduct the slab repair with the same equipment, placing crew, and methodology to meet the Contract requirements for conducting the slab repair on any Contract within the last 12 months.

The trial slab repair shall be conducted on both the intermittent slab and continuous slab. The Contractor shall propose the location of the trial slab repair to the Contract Administrator for approval. The Contract Administrator shall be given a minimum of 48 hours notice prior to the trial slab repair.

The Contract Administrator shall allow the Contractor to continue the slab repair work based on an acceptable visual assessment of the trial. When the slab repair is rejected by visual assessment, the Contractor shall repeat additional trial slab repair until the slab repair meets the requirements of this specification.

The Contractor shall be responsible for the repair, removal, or reinstallation of any unacceptable trial repair slabs.

363.07.02  Operational Constraints

Perimeter sawcutting of the removal area shall not be carried out more than 1 week in advance of the expected date of repair.

Bedding grout and dowel grout shall be carried out as soon as possible after the installation of the precast concrete pavement slab

The temperature of the flowable fill mixture used for the Michigan Method, as manufactured and delivered, shall be at least 10 °C. No placement of flowable fill will be allowed if the anticipated air temperature will be 2 °C or less in the 24 hour period following proposed placement.

The PCRM shall not be placed when the air temperature is outside the manufacturer’s recommended temperature range or is likely to fall or rise outside the range throughout the duration of the material placing operation. Prior to placing the PCRM, the Contractor shall demonstrate to the Contract Administrator that the existing concrete temperature in the repair area meets the manufacturer’s requirements by measuring and recording the substrate temperatures using a contact thermometer or infrared thermometer.

Construction vehicles, equipment, or traffic shall not be permitted to travel on the precast repair until the PCRM has attained a minimum compressive strength of 20 MPa.

Each repair location shall be completed within the time period specified in the Contract Documents. If the repair is not progressing at a rate that will permit the full restoration of traffic within the allowable time period, appropriate measures acceptable to the Contract Administrator shall be undertaken to allow opening of the road to traffic. Full depth precast concrete slab repairs shall replace the above temporary work during the next scheduled closure.
363.07.03  Removals

A template shall be used to precisely delineate the limits of the areas to be repaired within a tolerance of 12 mm. Repairs shall be the full width of the lane and full depth of concrete or hot mix asphalt repair.

Concrete removal shall be carried out in accordance with OPSS 510. The outer limits of the removal area shall be sawcut full depth and shall not be overcut by more than 250 mm into the adjacent concrete that is to remain in place. Overcuts shall be filled with a proprietary product acceptable to the Owner.

Concrete removal shall be by lift-out method. Removals shall be carried out without damaging the adjacent concrete pavement or asphalt shoulder or disturbing the underlying base. Heavy breaking equipment such as hoe rams shall not be used in the removal operation. The concrete pavement shall not be broken in place.

If the adjacent concrete is damaged or cracked due to the removal procedure, the damaged concrete shall be repaired according to OPSS 360. Asphalt surfaces damaged during the removal process shall be repaired. The Contractor shall provide a proposal for repairs to the Contract Administrator for approval.

363.07.04  Base Preparation

363.07.04.01  General

Levelling material shall be either a flowable fill for the Michigan Method or fine aggregate for the Fort Miller Super-Slab® Method, meeting the requirements of this specification.

Micro-grinding of the existing cement treated base is recommended if minor adjustment for the base level is required.

363.07.04.02  Flowable Fill - Michigan Method

The batching equipment shall have devices designed to measure the specified quantities of each component material, and mixing shall be of sufficient duration to ensure uniform consistency of the mixture. Water content shall be maintained such that compressive strengths are achieved and a uniform, flowable mixture is developed that is essentially self-levelling when placed.

363.07.04.03  Fine Aggregate – Fort Miller Super-Slab® Method

Fine aggregate shall be compacted then fine graded using a screeding device capable of grading the fully compacted bedding material to the required tolerance.

363.07.05  Steel Reinforcement

Steel reinforcement shall be according to OPSS 905.

363.07.06  Dowel Bar Installation - Michigan Method

363.07.06.01  Sawcutting Dowel Bar Slots

Slots shall be created using gang saws. The slots shall be 65 mm wide by 450 mm long and to a maximum depth to allow the dowel bar to be placed at mid slab depth with 12 mm cover under the bar. The slots shall be parallel to the centreline of the roadway with a maximum tolerance of 3 mm from a parallel line.
Equipment shall not cause damage to the existing pavement. All slurry from the sawcutting operation shall be removed from the slot and pavement. Over-cutting dowel bar slots is not permitted.

363.07.06.02 Concrete Removal in Dowel Bar Slots

Chipping hammers shall be used to remove concrete within the slots. Concrete shall be removed to ensure the bottom of the slot is level and in such a manner as to prevent damage to the concrete remaining in place. If the concrete removal operation causes damage to the adjacent concrete pavement, the Contractor shall immediately take corrective action.

If during the removal process the adjacent concrete is damaged due to the removal operation, the damaged concrete shall be repaired as a partial depth repair according to OPSS 360.

The chipping hammers shall not be permitted to break through the concrete. In the event of a break through or if crack develops within a slot, the repair shall be treated as a full depth repair and the entire joint within the lane shall be removed and replaced with a 2 m full depth concrete repair according to OPSS 360.

363.07.06.03 Slot Cleaning

All concrete surfaces within the slot shall be solid, free from loose or unsound fragments. All concrete surfaces shall be abrasive blast cleaned according to OPSS 929 and all dust and loose material shall be removed from the prepared surface by using compressed air.

363.07.06.04 Placing the PCRM in Dowel Bar Slots – Michigan Method

All concrete surfaces within the slot shall be in accordance with manufacturer’s requirements. Care shall be taken to prevent standing water in the slot. Prior to placing the PCRM, all excess water shall be removed with compressed air.

The treatment of the concrete surfaces within the slot with a bonding agent, if required by the manufacturer, and the mixing, placing, finishing, and curing of the PCRM shall be done according to the manufacturer’s recommendations. A metering or measuring device shall be used to establish the correct amount of mixing water. The Contractor shall assure that each batch of PCRM is consistent.

When placing the PCRM in the slot, the Contractor shall not spill any onto the adjacent concrete surface. The PCRM shall be vibrated to consolidate the material into the slot and around the dowel bar.

The PCRM shall be finished flush with the surface of the concrete and all excess material removed immediately. Hand finishing shall be minimized to prevent overworking of the repair. The PCRM shall be cured according to the manufacturer’s recommendations.

363.07.07 Dowel Bar and Tie Bar Installation - Fort Miller Super-Slab® Method

Gang drills shall be used to drill holes in the existing concrete for insertion of dowel bars. The diameter of the drill holes shall be no more than 5 mm larger than the diameter of the dowel bars or tie bars. Drill holes shall be thoroughly cleaned by air blowing from the back of the drill hole outwards. Drilling equipment shall be used in a manner to ensure adjacent pavement is not damaged.

Dowel bars and tie bars shall be secured into the existing concrete with an epoxy adhesive. The epoxy adhesive shall be injected into the back of the cleaned drill hole and the dowel bar or tie bar, with grout retention disks attached, shall be inserted to ensure the bars are completely encased with epoxy adhesive for
the full depth of the hole. Tie bars and dowel bars shall be installed as specified in the Contract Documents. Tie bars are only required for continuous repairs.

363.07.08  
**Slab Installation - Fort Miller Super-Slab® Method**

Guide slabs into position during installation using guide bars inserted in bedding grout port holes to align slabs during setting. The use of pry bars or wedges in joints for alignment purposes shall not be permitted.

The vertical differential between adjacent slabs shall be less than 6 mm. If the vertical differential is greater than 6 mm, the slab shall be removed, the base re-graded, and the slab re-set until the differential is less than 6 mm before moving on to the next slab.

If slabs are to be opened to traffic before they are grouted, incompressible shims shall be placed at approximate ¼ points in both the transverse and longitudinal joints to maintain horizontal alignment of the new precast slabs until they are grouted. If un-grouted slabs are vertically displaced such that the vertical differential is greater than 6 mm as described above, the slab shall be removed, the base re-graded, and the slab re-set prior to grouting, or the surface shall be brought to the required tolerance by grinding as required by this specification.

363.07.09  
**Placing the Dowel Grout and Bedding Grout - Fort Miller Super-Slab® Method**

Foam grout dams shall be installed at the open ends of the transverse joint to be grouted to prevent dowel grout from escaping during the installation. Dowel grout shall be mixed in strict accordance with the instructions provided by the manufacturer. The volume of water shall be measured accurately for each batch by weighing the batch water or by using calibrated pails that are perforated at a level to ensure the correct amount of water is mixed with each bag of grout. Dowel grout shall be pumped in the back port of each dowel slot until it comes out the second port in the same slot. Place foot over the second port and continue pumping until the grout flows along the joint to the next slot. Proceed to the back port of the next slot and repeat the same procedure. Continue to monitor the grout level in previously filled ports. Add grout as necessary to keep the grout level in the ports even with the top of the slab and in the joints above the top of the slots.

Bedding grout shall be placed after the dowel grout has been installed. Mix bedding grout in strict accordance with the instructions provided by the manufacturer of the viscosity-reducing admixture. Start pumping bedding grout in the lowest port of the slab until it comes out the corresponding port at the other end of the slab. While filling the remaining ports in the slab continue to monitor the grout level in previously-filled ports and add grout as required to keep the grout level in the ports even with the top of the slab. This will maintain a safe and adequate head pressure on the bedding grout until all voids under the slab are filled.

Before the bedding grout fully sets, the top 50 mm of bedding grout in each port shall be removed and replaced with PCRM. The PCRM in all ports shall be finished flush and matching with the surface of the concrete and all excess material removed immediately.

363.07.10  
**Tolerances**

363.07.10.01  
**Dowel Bar and Tie Bar Tolerances**

Dowel bars shall be installed mid-depth of the concrete slab, in a plane with the pavement surface and parallel to the centreline of the road. Tie bars shall be installed mid-depth of the concrete slab, in a plane with the pavement surface and perpendicular to the longitudinal lane edge sawcut face. The tolerance for the alignment
of dowel bars and tie bars shall be ± 15 mm along the length of the bar in both the vertical and horizontal planes of the pavement and parallel to the direction of traffic.

363.07.10.02 Surface Tolerances

The surface of the precast concrete slab repair shall join flush with the existing concrete pavement. Surface tolerance of intermittent repair slabs shall be such that when tested with a 3 m long straight edge placed in the longitudinal direction there shall not be a gap greater than 6 mm between the bottom of the straightedge and the surface of the pavement. Surface tolerance of continuous slabs shall be such that the gap is not greater than 6 mm when the straight edge is placed in any location and direction, including the edge of pavement, except across the crown or drainage gutters.

363.07.11 Joint Sealing

All longitudinal and transverse joints shall be sealed according to OPSS 369.

363.07.12 Sampling and Testing

363.07.12.01 General

All samples, including those handled by a commercial carrier shall be accompanied by a sample data sheet and any additional documents as specified elsewhere in the Contract Documents. Where not specified or not included on the sample data sheet, samples shall be delivered with a transmittal form identifying the following information:

a) Contract Number.
b) Name of Contractor, name of contact person and telephone numbers.
c) Name of Contract Administrator, and telephone numbers.
d) Quantity and type of sample. When a sample consists of more than one item, each item shall be individually identified.
e) Date sampled.
f) Date shipped.
g) Sample, lot, and sublot number.
h) Sample location.

363.07.12.02 Compressive Strength of Concrete in Precast Slab

The Contractor shall cast, cure, handle, and deliver concrete test cylinders for 28-Day compressive strength testing according to OPSS 1350 based on 1 set of 2 cylinders taken for each batch of concrete.

363.07.12.03 Compressive Strength of Flowable Fill

The compressive strength of the flowable fill shall be determined by casting cylinders. The Contractor shall cast, cure, handle, and deliver two sets of two standard 150 x 300 mm cylinders to represent a day's placement. Cylinders for testing the 3-Day and 28-Day compressive strengths shall be stored and cured according to OPSS 1350, then transported to a quality assurance (QA) laboratory designated by the Owner in the Contract Documents. Testing for 28-Day compressive strength shall be conducted according to OPSS 1350, except specimens shall be air cured in their moulds until they are to be tested.
Compressive Strength of Proprietary Concrete Repair Materials and Bedding Grout

The Contractor shall be responsible for sampling the PCRM from the mixer in the field and making cubes for determination of the early strength and 28-Day compressive strength. The PCRM cubes shall be moulded according to CAN/CSA A3004-C2.

Cubes shall be prepared on-site from the PCRM to be used to fill the slots. For the 28-Day compressive strength, the PCRM shall be sampled once for every 4 hours of production or a minimum of once per day, whichever is greatest. One set of six cubes shall be made from each sample of PCRM.

Additional cubes for determination of early strength shall be prepared by the Contractor. The Contractor shall make one set of six cubes for the final repair area of each closure. These cubes shall be tested to verify that the PCRM in the repair area has attained a compressive strength of 20 MPa. These test results shall be communicated immediately to the Contract Administrator prior to opening to traffic.

The Contractor is responsible for the timing of testing and frequency of testing of the early strength cubes and shall determine when the PCRM has attained a minimum compressive strength of 20 MPa.

The specimens shall be stored at a temperature between 15 °C and 25 °C and shall not be moved prior to demoulding. The Contractor shall demould and transport the specimens to the QA laboratory designated by the Owner within 24 hours ± 4 hours. The samples shall be transported in a sealed white opaque plastic bag containing at least 250 ml of water and maintained at a temperature between 15 °C and 25 °C.

Falling Weight Deflectometer Testing

The Contractor shall carry out Falling Weight Deflectometer (FWD) testing on the approach and leave joints of each precast slab to determine the load transfer efficiency across the transverse joints. FWD testing, equipment calibration, and reporting shall be according to MERO-019 using the Load Transfer test with a Detailed Project Level data collection scenario and a JCP Test Plan configuration.

Repair or Removal of Unacceptable Concrete

Precast concrete pavement slabs that arrive on the job site cracked, honeycombed, or showing any other visually detectable deficiencies shall be rejected and not used in the work.

Precast concrete pavement slabs which do not meet the surface tolerance requirements shall be removed and replaced, or corrected by diamond grinding.

Concrete pavement adjacent to precast concrete slab repair, damaged or displaced during installation of the precast repair shall be removed and replaced with new concrete as specified.

Management of Excess Material

Management of excess material shall be according to the Contract Documents.
363.08 QUALITY ASSURANCE

363.08.01 Inspection

Prior to installation and with notification, the Contractor shall provide access to the Contract Administrator to inspect the precast concrete pavement slabs to ensure that they are properly textured and crack-free with no honeycombing or other visually detectable deficiencies.

363.08.02 Acceptance or Rejection

Prior to opening to traffic, the Contractor shall provide access to the Contract Administrator to inspect the precast concrete slab repairs to determine if the completed work contains:

a) Cracking or spalling.

b) Ungrouted saw over-cuts from the removal process.

c) Rocking of precast concrete pavement slab.

d) Precast concrete pavement slab that does not meet surface tolerance.

The Contract Administrator shall reject precast concrete pavement slab repairs based on the presence of one or more of the defects identified above or one or more of the following conditions:

a) FWD testing results indicate a load transfer efficiency of less than 70%.

b) Compressive strength of the precast slab less than 30 MPa at 28 Days.

c) Air content of the hardened concrete in the precast slab is less than 3% or spacing factor is greater than 0.230 mm.

The Contractor shall submit a detailed remedial plan to the Contract Administrator for approval to address identified deficiencies.

363.09 MEASUREMENT FOR PAYMENT

363.09.01 Actual Measurement

363.09.01.01 Precast Concrete Slab Repair

Measurement of the precast concrete slab repair placed shall be by area in square metres. The total area shall be calculated to the nearest 0.1 m².

363.09.02 Plan Quantity Measurement

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.
363.10   BASIS OF PAYMENT

363.10.01  Precast Concrete Slab Repair – Item

Payment at the Contract price for the above item shall be full compensation for all labour, Equipment, and Material required to do the work.

Measures taken to permit full restoration of traffic within the allowable time period shall be at no extra cost to the Owner.

Precast concrete pavement slabs that do not meet surface tolerance requirements shall be either removed and replaced or repaired by diamond grinding at no extra cost to the Owner.

Precast concrete pavement slabs rejected by the Contract Administrator shall be removed and replaced with new concrete as specified elsewhere in the Contract at no extra cost to the Owner.

Concrete adjacent to and damaged by the removal process shall be cut back full depth to sound concrete and replaced at no extra cost to the Owner.

Asphalt surfaces damaged during the removal process shall be repaired at no extra cost to the Owner.

Full depth repairs required as a result of chipping hammers breaking through the concrete or a crack developing as a result of chipping operations shall be carried out at no extra cost to the Owner.
